

Technical Advisory – Refreshed TREDIS User Interface

The TREDIS user interface has been enhanced to simplify input selections and improve interactive performance of the system. Details of the new user interface features are described in the help system and user documentation accessible via the menu icon at the upper right side of each screen. The following is a summary of the enhancements:

- Consolidation of the Analysis Type screen with the Project Screen. When a project is created, the user will select the analysis type, with Standard Analysis as the default. Rarely used analysis types have been removed to focus on delivering improvements to the Standard Analysis and future feature development.
- The preference setting for selecting Travel Speed or Travel Time has been applied to the Standard Analysis, adding more flexibility to your analyses.
- The dropdown menus for selecting project timing have been replaced with sliders which show the project timeline as it is being defined.

- Defining regions has been enhanced to allow for selecting counties and custom regions using either a clickable map or a list of counties and/or custom regions.

- Speeds for reloading a TREDIS screen have been significantly increased.
